Default encodings in Xe\LaTeX\ and Lua\LaTeX\n
The default encoding in \LaTeX\ has always been the original 128-character encoding \texttt{OT1}. For Unicode based \TeX\ engines, this is not really suitable, and is especially problematic with Xe\LaTeX\ as in the major distributions this is built with Unicode based hyphenation patterns in the format. In practice this has not been a major problem as documents use the contributed \texttt{fontspec} package in order to switch to a Unicode encoded font.

In this release we are adding \texttt{TU} as a new supported encoding in addition to the previously supported encodings such as \texttt{OT1} and \texttt{T1}. This denotes a Unicode based font encoding. It is essentially the same as the \texttt{TU} encoding that has been on trial with the experimental \texttt{tuenc} option to \texttt{fontspec} for the past year.

The Xe\LaTeX\ and Lua\LaTeX\ formats will now default to \texttt{TU} encoding and \texttt{lmr} (Latin Modern) family. In the case of Lua\LaTeX\ the contributed \texttt{luaotfload} Lua module will be loaded at the start of each run to enable the loading of OpenType fonts.

The \texttt{fontspec} package is being adjusted in a companion release to recognise the new encoding default arrangements.

Note that in practice no font supports the full Unicode range, and so \texttt{TU} encoded fonts, unlike fonts specified for \texttt{T1}, may be expected to be incomplete in various ways. In the current release the file \texttt{tuenc.def} that implements the \texttt{TU} encoding-specific commands has made some basic assumptions for (for example) default handling of accent commands, and the set of command names is derived from the command names used for the UTF-8 support in the \texttt{inputenc} package, restricted roughly to the character ranges classically provided by the \texttt{T1} and \texttt{TS1} encodings, but is part of a longer term plan seen over recent releases to increase support for Unicode based \TeX\ engines into the core \LaTeX\ support.

If for any reason you need to process a document with the previous default \texttt{OT1} encoding, you may switch encoding in the usual ways, for example

\begin{verbatim}
\usepackage[OT1]{fontenc}
\end{verbatim}

or you may roll back all the changes for this release by starting the document with

\begin{verbatim}
\RequirePackage[2016/12/31]{latexrelease}
\end{verbatim}
\showhyphens in Xe\TeX

Due to the way Xe\TeX{} interfaces to font libraries, the standard definition of \showhyphens does not work. A variant definition has been available in the contributed x Grat package, however a (slightly different) definition for \showhyphens is now included in Xe\TeX{} by default. As usual this change will be undone if an earlier release is specified using the latexrelease package.

The fixlt2e package

As described in \TeX{} News 22, the fixlt2e package has become obsolete with the new update policy. Since 2015 it has just made a warning and exited. In this release we have re-introduced all the code from the original fixes in the 2014 \TeX{} but guarded by \IncludeInRelease{2015/01/01}{latexrelease}. So for current releases fixlt2e still just displays a warning but for old releases, whether that is an old format, or a format with the version date reset via the latexrelease package, the fixes in the original fixlt2e will be applied.

This improves the ability to run old documents in a way that is compatible with contemporary formats. If you have a 2014 document that used \usepackage{fixlt2e} and you add \RequirePackage[2014/01/01]{latexrelease} and process it with the current format then latexrelease will undo most changes made since 2014, but now when the document includes fixlt2e it will act like a 2014 version of the package and apply the code fixes, not just give a warning that the package is obsolete.

The latexbug package

As explained in more detail at the \TeX{} Project website\footnote{https://www.latex-project.org/bugs/}, a new package, latexbug, has been produced to help produce test files to accompany bug reports on the core \TeX{} distribution. This is being published separately to CTAN at the same time as this release. By using the latexbug package you can easily check that the packages to CTAN at the same time as this release. By using the latexbug package you can easily check that the packages involved in the test are all part of the core release. The \TeX{} project cannot handle bug reports on contributed packages, which should be directed to the package maintainer as given in the package documentation.

Updates to amsmath

The amsmath package has two updates at this release.

- The large delimiters around generalised fractions (for example in the \texttt{\binom} construct) did not work in previous releases if using Lua\TeX{} or Xe\TeX{} with OpenType math fonts. This is related to the lack of specific metrics for this use in the OpenType Math table. In principle Lua\TeX{} has two additional named metrics to control the delimiters but these are not initialised by default, and in Xe\TeX{} it does not seem possible to make them work at all. So for Unicode \TeX{} systems, a new implementation of \texttt{\genfrac} is used at this release that uses \texttt{\left\right} internally but parameterised to give spacing as close to the original as possible. The implementation in (pdf)\TeX{} is unaffected.

Updates to tools

The \texttt{array} package has been updated to fix a longstanding but previously unreported issue with unwanted interactions between tables in the page head or foot and the body of the page, as reported in PR tools/4488. There is also an update to the Lua\TeX{} support in bm.

An addendum to the release changes in 2015: page breaks and vertical spacing

In 2015 we announced the introduction of the roll-back/roll-forward concept to manage bug fixes and additions to core \TeX{} in a manageable way. We also announced at that time that we now incorporate all fixes from fixlt2e into the kernel (as the old mechanism produced problems instead of improving the situation). Refer to l1news22.pdf for details.

One of the fixes from fixlt2e was for a glaring bug in \texttt{\addvspace} that was originally detected in the mid-nineties and back then added to the fixlt2e support package. In certain situations \texttt{\addvspace} would result in a page/column break below the baseline of the last line. As a result documents using \texttt{\flushbottom} would show a clear misalignment (even more prominent when typesetting in two-column mode).

Starting with release 2015/01/01 this is now finally corrected already in the kernel and not only in fixlt2e. In nearly all circumstances this will either make no difference to existing documents, or it will locally improve the visual appearance of that document without changing anything on other pages. However, by the nature of the change it is also possible that there are further non-local changes to the page breaks due to the different break positions introduced by the fix.

Thus, for documents that have been written before 2015 and that should be preserved unchanged at all costs you may have to add \texttt{\RequirePackage[2014/01/01]{latexrelease}} at the top of the document, to roll back the format to a date before the policy change.
