Abstract

This package is intended to be used with the \texttt{amsart} documentclass only. It lets you move the authors’ affiliations either just below the authors’ names on the front page or as footnotes on the first page. The email addresses are always listed as a footnote on the front page.

E-Mail: jerome.lelong@gmail.com

This program can be redistributed and/or modified under the terms of the \LaTeX{} Project Public License, distributed from CTAN archives available from \url{http://www.latex-project.org/lppl.txt}; either version 1.3c of the License, or (at your option) any later version.

2 Usage

To use this package, you need to include the directive \texttt{\usepackage{amsaddr}} in your \texttt{.tex} file. Alternatively, you may also use it with the \texttt{foot} option \texttt{\usepackage[foot]{amsaddr}}. When using the \texttt{foot} option, the addresses are put as footnotes on the first page of the document.

A typical usage looks like the following

\begin{verbatim}
\author{author one and author two}
\address{common address of authors one and two}
\end{verbatim}

*This document corresponds to \texttt{amsaddr} v1.2, dated 2022/09/10.
If amsaddr is used without the foot option, the addresses declared with the address command are printed just below the authors’ names declared with the preceding author command. The emails appear as a footnote like this:

E-mail addresses: email one, email two, and so on

If the option foot was passed to the package, you may consider numbering authors’ names so that you can use numbered footnotes for the affiliations.

As in standard amsart documents, an option can be passed to the author command to specify the replacement for the author’s name on the running headers.

3 Implementation

The foot option enables to move the affiliation related material to the bottom of the first page as footnotes.

The \author macro can be used the same way as in other amsart documents. The variable g@author is used to count the total number of authors.
\email The \email command is used to specify the different authors. The email addresses can be specified in a unique command or using separate invocations of the command.

\email The \email command is used to specify the different authors. The email addresses can be specified in a unique command or using separate invocations of the command.

\process The \process macro is used to print the addresses as footnotes. This macro is called when the foot option is passed to the package.

\setfoot The \setfoot macro is used to print the addresses as footnotes. This macro is called when the foot option is passed to the package.
\setaddresses The \setaddresses macro is used to process the addresses when they are to appear just below the authors' names on the front page.

\setemails The \setemails macro is called by the \maketitle command to print the email addresses.

\maketitle The \maketitle macro is used to replace the standard \makefile command. Before issuing this command, no authors, affiliations, nor emails are printed.
\if@titlepage
\newpage
\else
\dimen@34\p@ \advance\dimen@-\baselineskip
\vskip\dimen@\relax
\fi
\let\addresses\relax
\let\@setfoot@addresses\relax
\} % end \@maketitle

In \texttt{amsart} documents, affiliations are normally printed by the \texttt{\enddoc@text} command. To avoid a double printing of the considered material, the \texttt{\enddoc@text} macro has to be redefined.

\begin{verbatim}
\def\enddoc@text{
\ifx\@empty\addresses\else \@setaddresses\fi
}\end{verbatim}

\textbf{Change History}

\begin{verbatim}
v1.0
  General: Initial version ........ 1

v1.1
  General: Fix space alignment ...... 1

v1.2
  General: Fix error with dedicatory ............. 1
\end{verbatim}
